DETAILED ACTION

Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on July 1, 2004 has been entered.

Claim Rejections - 35 USC § 103

- 2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 3. Claims 1-4, 6-8, and 10 are rejected under 35 U.S.C. 103(a) as being unpatentable over Willard, Jr. (US 5,795,416, newly cited) and further in view of Willard, Jr. (US 5,427,166, of record) and Yokoyama (JP 06087977, newly cited). As best depicted in Figures 4 and 6, Willard '416 is directed to a pneumatic, runflat tire construction having a tread belt package, a pair of sidewalls, a chafer or bead support rubber 34 (contains a rim flange protector that protrudes axially outward), and a chafer reinforcement fabric or bead protector ply 27. While it is unclear from these figures if the bead protector ply is positioned at a surface of the chafer over the entire contact region between the chafer and the rim, such a design is extremely well known and

Art Unit: 1733

extensively incorporated into similar tire constructions in order to eliminate any direct interaction between the chafer and the rim (results in heat buildup and reduced tire performance). For example, Willard '166, as best depicted in Figures 1, 2, and 4, is directed to an extremely similar tire construction in which the bead protector ply is arranged over the entire surface of the chafer in order to eliminate contact between the chafer and the rim. Absent any conclusive showing of unexpected results, one of ordinary skill in the art at the time of the invention would have found it obvious to extend the bead protector ply over the entire surface of the chafer for the benefits detailed above. Regarding the compositions of the sidewall and the bead support rubber (chafer), Willard '416 only states that the sidewall can be made of any suitable compound based on natural or synthetic rubber or any suitable combination thereof known in the art (Column 14, Lines 34-38)- the reference is completely silent as the composition of the bead support rubber. Yokoyama, on the other hand, is directed to a pneumatic tire construction in which the same rubber composition can be used in the sidewall and the chafer in order to suppress the curving of the respective rubber members (related to improved processing) and reduce the temperature dependence of several physical properties, whereby improved tire uniformity is ultimately achieved. It is further noted that the specific composition defined by Yokoyama is a blend of natural/isoprene rubber and syndiotactic polybutadiene- this is consistent with the description by Willard '416 that the sidewall should be formed of "any suitable compound based on natural or synthetic rubber or any suitable combination thereof known in the art". As such, one of ordinary skill in the art at the time of the invention

Art Unit: 1733

would have found it obvious to form the sidewall and chafer of Willard '416 from the same rubber composition in view of Yokoyama, wherein only the expected results would be achieved.

Regarding claims 2 and 3, the bead protector ply of Willard '166 is depicted as extending along the outer surface of the chafer, wherein the portion of the chafer that protrudes axially outward along the rim flange is seen to constitute a rim flange protector. It is emphasized that it would have been within the purview of one of ordinary skill in the art at the time of the invention to appropriately position the protector ply as desired.

As to claim 4, the bead protector ply of Willard '416 reinforces and protects the bead area by extending along the surfaces of the bead toe and the bead base.

Regarding claims 6-8 and 10, Willard '416 is completely silent as to the makeup of the bead protector ply. One of ordinary skill in the art at the time of the invention would have found the fibrous arrangements of the claimed invention to have been obvious since they are consistent with the well known and extensively used arrangements. For example, Willard '166 discloses the bead protector ply as being a square woven fabric in which non-metallic fibers, such as aramid, rayon, and nylon, are individually inclined at an angle of ±45 degrees, such that the weaving angles are approximately 90 degrees. As set forth in the previous office action, one of ordinary skill in the art at the time of the invention would have recognized that said fabric is rubber impregnated (position not challenged by applicant).

Application/Control Number: 10/004,123 Page 5

Art Unit: 1733

4. Claim 9 is rejected under 35 U.S.C. 103(a) as being unpatentable over Willard '416, Willard '166, and Yokoyama as set forth in the rejection of claim 1 above and further in view of Schmidt (US 3,902,356, of record). As noted in the previous paragraph, Willard '416 is completely silent as to the makeup of the bead protector ply (chafer reinforcing fabric). Willard '166, on the other hand, evidences the well-known construction of similar bead protector plies- that being a square woven fabric formed of textile materials. While the reference fails to expressly suggest the use of monofilament fibers, one of ordinary skill in the art at the time of the invention would have readily appreciated and expected such a square woven fabric to be formed of monofilament fibers since such fibers are extensively used, particularly as warp elements, in the formation of square woven fabric components, as shown for example by Schmidt (Column 2, Lines 50-58). As such, it would have been obvious to one of ordinary skill in the art at the time of the invention to form the square woven fabric suggested by Willard '166 from monofilament fibers, there being no evidence of unexpected results to establish a criticality for such a construction.

Response to Arguments

5. Applicant's arguments with respect to claims 1-10 have been considered but are moot in view of the new ground(s) of rejection. As correctly set forth by applicant, the sidewall and chafer of Willard '166 are not formed of a single, unitary construction of elastomer. As such, the previous rejections with Willard '166 have been removed. However, newly cited Willard '416 is completely silent to the composition of the sidewall and chafer, only stating that "the sidewall should be formed of any suitable compound

Art Unit: 1733

based on natural or synthetic rubber or any suitable combination thereof known in the art". In view of Yokoyama, one of ordinary skill in the art at the time of the invention would have found it obvious to from the sidewall and the chafer from the same composition- this is seen to constitute a single, unitary construction of elastomer. Furthermore, the specific composition suggested by Yokoyama is a blend of natural/isoprene rubber and polybutadiene (synthetic), which is consistent with the limited description of the sidewall provided by Willard '416. Thus, one of ordinary skill in the art at the time of the invention would have found it obvious to form the sidewall and chafer of Willard '416 from the same composition in order to suppress the curving of the respective components (related to processing) and reduce the temperature dependency of physical properties, both of which contribute to improved tire uniformity.

Conclusion

6. Any inquiry concerning this communication or earlier communications from the examiner should be directed to **Justin R Fischer** whose telephone number is **(571) 272-1215**. The examiner can normally be reached on M-F (7:30-4:00).

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Blaine Copenheaver can be reached on (571) 272-1156. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.
